

patent pending

The savings start now!

Cla-Val's all new, all hydraulic Advanced Pressure Management Valve lets you automatically manage water distribution system pressure based on demand.

When normal operating pressure is reduced, you'll have fewer pipe breaks, less background leakage and you'll save energy and money because your pumping requirements will also go down.

In the event of extreme demand, such as for fire flow, the valve will automatically adjust pressure to meet the demand -- without external devices such as orifice plates, meters or SCADA communication.

Simple • Affordable • Retrofittable
