Spectacular!

From the moment it is installed in your water distribution system, the all hydraulic **Cla-Val 98 Series Advanced Pressure Management Valve** starts reducing the incidence of pipe breaks.

It does this by automatically adjusting pipeline pressure based on demand: At night or during off-peak periods -- **when most breaks occur**-- pressure is reduced, keeping the pipeline from being overpressurized.

When there is a sudden increase in demand, such as for fire flow, the valve automatically adjusts pressure to the maximum set point, without any external devices such as orifice plates, meters or SCADA communication.
