INTRODUCTION
The Cla-Val 50-49 is an automatic control valve designed to maintain constant upstream pressure to close limits. It is a hydraulically operated, pilot controlled, modulating type valve.

The valve is actuated by inlet line pressure, opening to maintain a steady line pressure and closing gradually to prevent surges. When inlet pressure is below the pressure setting CRL pilot control, the main valve and pilot are closed drip tight. Pressure setting adjustment is made with single adjusting screw that has a protective cap to discourage tampering.

INSTALLATION
1. Allow sufficient room around the valve assembly to make adjustments and for servicing.
2. It is recommended that gate or block valves be installed to facilitate isolating valve for preventative maintenance. When used as a surge control or pressure relief valve where valve outlet discharge is to atmosphere, then a gate or block valve is needed at valve inlet.

NOTE: BEFORE THE VALVE IS INSTALLED, PIPE LINES SHOULD BE FLUSHED OF ALL FOREIGN MATTER.

3. Place valve in line with flow through valve in direction indicated on inlet plate or flow arrows. Check all fittings and hardware for proper makeup and verify that no apparent damage is evident.
4. Cla-Val Valves operate with maximum efficiency when mounted in horizontal piping with the cover UP; however, other positions are acceptable. Due to size and weight of cover and internal components on six inch and larger valves, installation with the cover up is advisable. This makes periodic inspection of internal parts readily accessible.

5. Caution must be taken in the installation of this valve to insure that galvanic and/or electrolytic action does not take place. The proper use of dielectric fittings and gaskets are required in all systems using dissimilar metals.

OPERATION AND START-UP
1. Prior to pressurizing the valve assembly make sure the necessary gauges to measure pressure in the system, are installed as required by the system engineer. CAUTION: During start-up and test a large volume of water may be discharged downstream. Check that the downstream venting is adequate to prevent damage to personnel and equipment. All pilot adjustments should be made slowly in small increments. If the main valve closes too rapidly it may cause surging in upstream piping.
2. If isolation valves (B) are installed in pilot system open these valves (see schematic).

3. Remove cap on the CRL Pressure Relief Control, loosen jam nut and turn adjusting screw clockwise until spring is fully compressed. This puts the control in full closed mode and will cause the main valve to close when system is pressurized.
4. If a downstream block valve is installed, slowly open this valve.
5. Partially open upstream block valve. The main valve should close.

6. Carefully loosen the plug at top of indicator assembly. Bleed air from cover and tighten plug or bleed valve. Carefully loosen tubing fittings at highest points and bleed air from system. Retighten fittings.

7. Open fully the upstream block valve and turn the CRL adjusting screw slowly counterclockwise until you begin to hear a flow through the control. The main valve should start to open. If the pressure is below the required relief setting, refer to the spring chart and turn the adjusting screw clockwise the number of turns required for the proper setting. Lock the jam nut and replace cover. An observation of the pressure relief setting should be made during usage. The controls can be readjusted as required.

MAINTENANCE
1. Cla-Val Valves and Controls require no lubrication or packing and a minimum of maintenance. However, a periodic inspection schedule should be established to determine how the fluid is affecting the efficiency of the valve assembly. Minimum of once per year.
2. Repair and maintenance procedures of the Hytrol Main Valve and control components are included in a more detailed IOM manual. It can be downloaded from our web site (www.cla-val.com) or obtained by contacting a Cla-Val Regional Sales Office.
3. When ordering parts always refer to the catalog number and stock number on the valve nameplate.

50-49 SCHEMATIC

BASIC COMPONENTS
1  100-S/2100S Hytrol (Main Valve)
2  CRL/CRL-60 Pressure Release Control
3  X44A Strainer & Orifice Assembly
4  81-01 Check Valve
5  CRA Pressure Reducing Control
6  CNA Needle Valve (opening)

OPTIONAL FEATURES
A  Hytrol Adjustment Screw, 3/8"-16UNF Thread
B  CK2 Isolation Valves
C  CV Flow Control (Closing)

1 HYTROL MAIN VALVE

- COVER
- PIPE PLUG
- HEX NUT
- FLAT WASHER
